SUMMARY

Staff / Lead Software Engineer in Amsterdam (26+ years, ex-AWS) with deep frontend expertise and broad full-stack background. Hands-on across architecture, design systems, React/Next.js, Node.js and platform infrastructure. At DataSnippet built frontend deployment platform (<20 min from idea to browser-testable env) and led frontend guild; implemented agentic workflows for the platform — skills-based knowledge base from 100+ repos and parallel agents on worktrees. Speaker & GitNation org. committee.

SKILLS

FULL-STACK: JavaScript, TypeScript, React, Next.js, Node.js, HTML & CSS

PLATFORM & DELIVERY: GitLab/GitHub CI/CD, Docker, Terraform, AWS, Azure

AI: Building AI agents, Agentic workflows, MCP, Skills — Cursor, Claude Code

EXPERIENCE

2024–Present **Senior Software Engineer, DataSnippet** <<https://datasnipper.com/>>

Created and led the frontend guild, establishing frontend architecture, engineering standards and development practices. Built the frontend deployment platform and reusable infrastructure that take a new application from idea to a deployed, browser-testable environment in under 20 minutes.

Implemented agentic workflows for the platform: built a skills-based knowledge base from 100+ repos and a workflow with up to five parallel agents on Git worktrees for platform development.

Claude Code, Cursor, MCP, Agentic workflows, React, Remix, TypeScript, Node.js, Technical Leadership, Terraform, Docker, GitHub CI/CD, Turborepo, CSS, HTML

2023–2024 **Staff Engineer, i3D.net** <<https://i3d.net/>>

i3D.net, a Ubisoft company, provides game hosting and global infrastructure for online games. I owned the frontend pillar: technical direction, coordination with other pillars, and support of the frontend engineers.

Defined the frontend architecture and infrastructure, introduced quality standards with processes to monitor and enforce them, and maintained the frontend roadmap. Created development paths and learning opportunities for engineers while staying hands-on with product work.

The result was a frontend platform and architectural standards that made it easier to add new applications and extend existing ones, including a dashboard for managing game hosting and deploying new games for enterprise customers and indie developers.

2023–2024 **Head of Department, Projector Institute** <<https://prjctr.com/>>

Helped build a frontend course lineup covering HTML, CSS, JavaScript, and React.js. Developed the processes for creating and maintaining courses from the ground up, including calculating and visualising teaching workload, preparing new courses for launch, and coordinating authors and teachers.

Technical Leadership, People Management

2021–2023 **Senior Software Engineer, Amazon Web Services (AWS)** <<https://aws.amazon.com/>>

Owned the frontend for the RDS Ops Console — the internal control plane AWS engineers use to operate Amazon RDS. Defined the frontend roadmap, including migrating the console from a legacy Ruby and jQuery stack to React and TypeScript, introduced code quality controls and a unit testing system with coverage enforcement, and built feedback mechanisms to surface UI/UX issues reported by console users. These improvements doubled (2×) the console's internal user satisfaction score. Also introduced canary testing across the console, giving the team confidence that critical functionality was working and letting us catch issues before they reached users.

Ruby, React, Next.js, Node.js, CSS, HTML, TypeScript

EDUCATION

2000–2007 **National Technical University of Ukraine 'Kyiv Polytechnic Institute'**

- o Specialist degree in development of electronic devices
- o Master's degree in computer science

How To Make Performance Visible With GitLab CI And Hoodoo Of GitLab Artifacts

It's not enough to optimize an application. You need to prevent performance from degradation, and the first step to do it is to make performance changes visible. This article shows a couple of ways of showing them in GitLab merge requests.

HTML Best Practice

Nowadays we neglect HTML. It's not even a programming language, what is the big deal?! But it has consequences. Bad ones. Let's make HTML great again!

Make your authentication flow perfect

Authentication is a pain point for many businesses, which lose a significant percentage of the potential customers on sign-up and sign-in steps. It's possible to improve the process in a way that would minimize this percentage.

Performance monitoring in the project

Everybody loves to talk about performance and how important it is. But nobody knows how their site is performing and how it's changing with time. Let's find out what we should measure, how we should do it, how to log it, and what standards may help us.
